Your name: _____

Exercise	Total	(a)	(b)	(c)	(d)	(e)
1	/10	/2	/2	/2	/2	/2
2	/12	/4	/4	/4		
3	/16	/4	/4	/4	/4	
4	/8	/4	/4			
5	/12	/4	/4	/2	/2	
6	/12	/4	/4	/4		
Total	/70					

Exercise 1

(10 pt) True/False. For each of the following statements, circle whether it is true or false. No justification is necessary.

Parts (a)–(b) concern the piecewise-linear function $f : \mathbf{R} \rightarrow \mathbf{R}$ graphed below.

(a) (2 pt) The definite integral $\int_0^3 f(x) \, dx$ is positive.

true

false

(b) (2 pt) The definite integral $\int_0^6 f(x) \, dx$ is positive.

true

false

(c) (2 pt) The integration procedure of change of variables (aka substitution) is related to the product rule from differential calculus, by viewing the latter in terms of antiderivatives.

true

false

For parts (d)–(e), let $f : [0, 1] \rightarrow \mathbf{R}$ be a function such that for all $x \in [0, 1]$, $f(x) > 0$; and let $F : [0, 1] \rightarrow \mathbf{R}$ be the cumulative signed area function given by $F(x) = \int_0^x f(t) \, dt$.

(d) (2 pt) There exists no $x \in [0, 1]$ such that $F(x)$ is negative.

true

false

(e) (2 pt) The average value of $f(x)$ on $[0, 1]$ is less than $f(1)$.

true

false

Exercise 2

(12 pt) Evaluate each indefinite integral. Clearly communicate your approach.

(a) (4 pt) $\int 4x^3 - 4x^2 + 6x + 3 \, dx$

(b) (4 pt) $\int e^{(x^2-2x)^2} (x^2 - 2x)(x - 1) \, dx$

(c) (4 pt) $\int z^2 e^{2z} \, dz$

Exercise 3

(16 pt) Evaluate each definite integral. Clearly communicate your approach.

(a) (4 pt) $\int_0^{\pi} \sin \theta - \cos(2\theta) \, d\theta$

(b) (4 pt) $\int_0^2 (1 - 2t)^2 - 1 \, dt$

(c) (4 pt) $\int_{-3}^3 \sqrt{9 - x^2} \, dx$

(d) (4 pt) $\int_{-1}^1 16x^3(1 + x^4)^3 \, dx$

Exercise 4

(8 pt) Use the fundamental theorem of calculus to compute the following derivatives.

(a) (4 pt) $\frac{d}{dx} \int_{-2}^x \cos(e^{\sin \sqrt{t}}) dt$

(b) (4 pt) $\frac{d}{dx} \int_{\sqrt{x}}^{x^2} \frac{t^2}{1+t^2} dt$

Exercise 5

(18 pt) Let $f : [-2, 4] \rightarrow \mathbf{R}$ be a piecewise function. A graph of $F(x) = \int_{-2}^x f(t) dt$ is shown below.

(a) (4 pt) Over which intervals is f positive? negative? equal to zero?

(b) (4 pt) Over which intervals is f increasing? decreasing? constant?

(c) (2 pt) What are the maximum and minimum values of f ?

(d) (2 pt) What is the average value of f on the interval $[-2, 4]$?

Exercise 6

(12 pt) Consider the functions $f : \mathbf{R} \rightarrow \mathbf{R}$ and $g : \mathbf{R} \rightarrow \mathbf{R}$ given by

$$f(x) = -x^2 + 4x$$

$$g(x) = x$$

respectively. A graph of f and g appears below.

This exercise explores the definite integral

$$\int_0^3 f(x) - g(x) \, dx$$

- (a) (4 pt) Evaluate $\int_0^3 f(x) \, dx$. That is, find the area between the graph of f and the x -axis, from $x = 0$ to $x = 3$.

- (b) (4 pt) Evaluate $\int_0^3 g(x) \, dx$. That is, find the area between the graph of g and the x -axis, from $x = 0$ to $x = 3$.

(c) (4 pt) Recall that linearity of the integral implies that

$$\int_0^3 f(x) - g(x) \, dx = \int_0^3 f(x) \, dx - \int_0^3 g(x) \, dx$$

Use this to help explain, geometrically, why the area between the graphs of $f(x)$ and $g(x)$ equals $\int_0^3 f(x) - g(x) \, dx$.
